

Artificial
Intelligence for the

American People

01 Executive Order on AI

02 AI for American Innovation

03 AI for American Industry

04 AI for the American Worker

05 AI with American Values

Overview

The age of artificial intelligence (AI) has arrived, and is transforming everything from healthcare to transportation to manufacturing.

America has long been the global leader in this new era of AI, and is poised to maintain this leadership going forward because of our strong innovation ecosystem. Realizing the full potential of AI for the Nation requires the combined efforts of industry, academia, and government. The Administration has been active in developing policies and implementing strategies that accelerate AI innovation in the

U.S. for the benefit of the American people. These activities align with several areas of emphasis: AI for American Innovation, AI for American Industry, AI for the American Worker, and AI with American Values. This AI.gov website provides a portal for exploring these activities in more depth, and serves as a resource for those who want to learn more about how to take full advantage of the opportunities of AI.

“Continued American leadership in Artificial Intelligence is of paramount importance to maintaining the economic and national security of the United States.”

— President Donald J. Trump

01

Executive Order on AI

The Trump Administration is committed to strengthening American leadership in artificial intelligence (AI). Recognizing the strategic importance of AI to the Nation’s future economy and security, the Trump Administration established the American AI Initiative via Executive Order 13859 in February 2019. This initiative identified five key lines of effort, including increasing AI research investment, unleashing Federal AI computing and data resources, setting AI technical standards, building America’s AI workforce, and engaging with international allies. These lines of effort were codified into law as part of the National AI Initiative Act of 2020.

In historic actions, the Administration committed to doubling AI research investment, established the first-ever national AI research institutes, issued a plan for AI technical standards, released the world’s first AI regulatory guidance, forged new international AI alliances, and established guidance for Federal use of AI.

To oversee and implement the U.S. national AI strategy, the White House established the National Artificial Intelligence Initiative Office in early January 2021, in accordance with the National AI Initiative Act of 2020. This Office serves as the central hub for Federal coordination and collaboration in AI research and policymaking across the government, as well as with private sector, academia, and other stakeholders.

Through these actions of the Trump Administration, together with the unparalleled enthusiasm and activity of the private sector and academia, the United States remains the world leader in artificial intelligence.

[Fact Sheet on the AI Executive Order](#)

[American AI Initiative: Year One Annual Report](#)

AI in Government

In September 2019, The White House hosted the Summit on Artificial Intelligence in Government to spark ideas for how the Federal government can adopt AI to better achieve its mission and improve services to the American people. Over 175 leaders and experts from government, industry, and academia came together to identify best practices in the use of AI, opportunities to foster collaborative partnerships, and ways to develop a Federal AI workforce. The Summit highlighted innovative efforts at Federal agencies that have already adopted AI, and looked ahead to future transformative AI applications that will make government more effective, efficient, and responsive.

An [AI pilot project](#) featured at this Summit by the Department of Health and Human Services led to a new effort announced by GSA to assist Federal agencies in [using AI to conduct regulatory review and improve the rule-making process](#).

Accelerating the adoption of AI in government, the General Service Administration (GSA) launched the [AI Center of Excellence](#) in September 2019, along with the [AI Community of Practice](#) soon thereafter. The AI Center of Excellence was later codified into law by the AI in Government Act of 2020. These efforts are supporting and coordinating the use of AI in the Federal agencies, helping to deploy scalable solutions and facilitating the sharing of best practices and tools for AI adoption.

In December 2020, the President signed [Executive Order 13960 on Promoting the Use of Trustworthy AI in the Federal Government](#), which establishes guidance for Federal agency adoption of AI to more effectively deliver services to the American people and foster public trust in this critical technology. This EO defines principles for the use of AI in Government, establishes a common policy for implementing the principles, directs agencies to catalogue their AI use cases, and calls on GSA and the Office of Personnel Management to enhance AI implementation expertise at the agencies.

White House Summit on AI for American Industry

In May 2018, The White House hosted the Summit on Artificial Intelligence for American Industry to discuss the promise of AI and the policies needed to realize that promise for the American people and maintain U.S. leadership in the age of AI. The summit brought together over 100 senior government officials, technical experts from top academic institutions, heads of industrial research labs, and American business leaders who are adopting AI technologies to benefit their customers, workers, and shareholders. At this summit, participants engaged in two sets of breakout sessions focused on cross-cutting issues such as AI R&D, workforce development, regulatory barriers to AI innovation, and sector-specific applications of AI.

02

AI for American Innovation

America's decades-long leadership in AI research and development has resulted in cutting-edge, transformative technologies that are improving lives, growing innovative industries, empowering workers, and increasing national security. These successes are the result of a strong, long-term emphasis on visionary, competitive, and high-payoff fundamental research programs that advance the frontiers of

AI. American R&D investments in AI are measured not only by the amount of our financial investment, but also in the quality and impact of the results.

As part of the Nation's AI Strategy, in February 2020 **the President committed** to doubling **nondefense AI R&D** over two years. These AI investments continue to emphasize the broad spectrum of challenges in AI, including core AI research, use-inspired and applied AI R&D, computer systems research in support of AI, and cyberinfrastructure and datasets needed for AI. Cross-disciplinary AI investments focus on the wide range of applications of importance to the nation, including science, medicine, communication, manufacturing, transportation, agriculture, and security. As described in the **NITRD Supplement to the President's FY2021 Budget** and detailed on the **NITRD AI R&D Investments dashboard**. AI investments are prioritized in agency budgets and coordinated across the Federal government to leverage the efficiencies of shared interests, while also identifying and filling gaps in our investment portfolios.

Our approach strengthens and leverages the unique and vibrant American R&D ecosystem, combining the strengths of **government, academia, and industry**. Special emphasis is placed on innovative public-private partnerships that accelerate AI discoveries. The result is a thriving R&D enterprise that maintains American leadership in AI technologies.

NSTC Select Committee on AI

To improve the coordination of Federal efforts related to AI, the White House chartered a Select Committee on AI in 2018 under the National Science and Technology Council. In early January 2021, the Select Committee was expanded and made permanent, and serves as the senior interagency coordination body referenced in the National AI Initiative Act of 2020. The Select Committee consists of the most senior R&D officials across the Federal government and represents a whole-of-government approach to AI R&D planning and coordination. This Committee advises the White House on interagency AI R&D priorities; considers the creation of Federal collaborations with industry and academia; establishes structures to improve government planning and coordination of AI R&D; oversees the annual coordinated interagency budget for AI; facilitates the coordination of the National AI Research Institutes; and identifies opportunities to prioritize and support the national AI R&D ecosystem. The Select Committee also provides guidance and direction to the NSTC Machine Learning and AI Subcommittee, which serves as the operations and implementation arm of the committee.

NSTC Select Committee on AI Charter

Key Agencies

AI R&D Strategic Plan

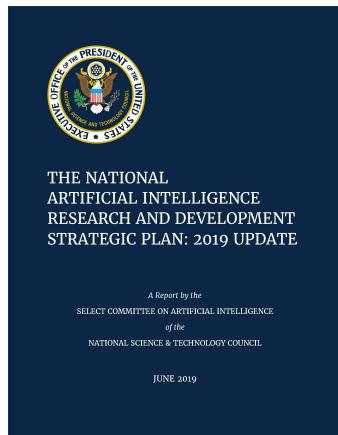

Guiding the Nation in our AI R&D investments is the [National AI R&D Strategic Plan: 2019 Update](#), which identifies the critical areas of AI R&D that require Federal investments. Released by the White House Office of Science and Technology Policy's National Science and Technology Council, the Plan defines several key areas of priority focus for the Federal agencies that invest in AI. These areas of strategic AI R&D focus include: continued long-term investments in AI; effective methods for human-AI collaboration; understanding and addressing the ethical, legal, and societal implications for AI; ensuring the safety and security of AI; developing shared public datasets and environments for AI training and testing; measuring and evaluating AI technologies through standards and benchmark; better understanding the National AI R&D workforce needs; and expanding public-private partnerships to accelerate AI advances.

The process for creating this Plan began in August of 2018, when the Administration directed the Select Committee on AI to refresh the 2016 *National AI R&D Strategic Plan* to account for significant recent advancements in AI, and to ensure that Federal R&D investments remain at the forefront of science and technology. The Select Committee then issued a Request for Information ([RFI](#)) to solicit input from the public on the current AI R&D Strategic Plan, to determine ways the strategy should be revised or improved. The responses to this RFI, as well as an independent agency review, informed the 2019 update to the Plan.

The *National AI R&D Strategic Plan: 2019 Update* defines the priorities for the overall portfolio for Federal AI R&D investments. Federal agencies take these priorities into account when developing their own budget proposals and agency plans, as appropriate to their

respective agencies' missions. This coordinated Federal strategy for AI R&D will help the United States to continue to lead the world in cutting-edge advances in AI that will grow our economy, increase our national security, and improve our quality of life.

In September 2019, agencies for the first time reported their nondefense R&D investments in AI according to this Plan, through the [**NITRD Supplement to the President's FY2020 Budget**](#). This new AI R&D reporting process provides an important mechanism and baseline for consistently tracking America's prioritization of AI R&D going forward. This report also provides insight into the diverse and extensive range of nondefense Federal AI R&D programs and initiatives.

National AI R&D Strategic Plan: 2019 Update

NITRD Supplement to the President's FY2020 Budget

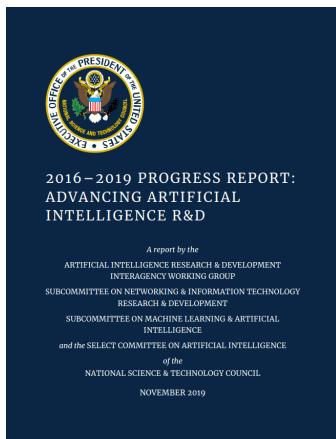

Progress on AI R&D

Research and development is a top priority of the United States national strategy for AI. Demonstrating this priority, in August 2020, [**the White House, NSF, and additional Federal partners announced \\$140 million**](#) in awards over five years to seven [**NSF-led AI Research Institutes**](#). These collaborative research and education institutes will focus on a range of AI R&D areas at universities around the country. Additional awards are anticipated in the coming years.

To document the impactful progress the nation has made in AI through Federal R&D investments, the White House issued the [**2016-2019 Progress Report: Advancing Artificial Intelligence R&D**](#) in November 2019. This progress report illustrates the considerable breadth and depth of Federal investments that are leading to transformative advancements in the state of the field. As a nation, we benefit significantly from the broad spectrum of Federal agencies that invest in AI from their unique mission perspectives, consistent with the national AI R&D strategy. For example, in December 2019 the Department of Veterans Affairs announced its [**National AI Institute**](#). With this institute, our country's AI R&D will benefit from the largest integrated health care system in the country and the largest genomic knowledge base in the world linked to health care information, provided by the VA. These investments are generating impactful breakthroughs that are revolutionizing our society for the better.

[**2016-2019 Progress Report: Advancing Artificial Intelligence R&D, November 2019**](#)

Computing Infrastructure for AI R&D

While algorithms and data play strong roles in the performance of AI systems, equally important is the computing infrastructure upon which the AI system runs. Advances in AI will continue to be dependent on hardware optimized for AI algorithms, including novel designs for neuromorphic computing, hardware accelerators for machine learning, embedded systems, and parallel architecture research motivated by AI processing requirements. The American AI Initiative calls for federal agencies to allocate high-performance and cloud computing resources to AI-related applications and R&D.

The United States is a world leader in the development of high-performance computing infrastructure that supports AI research. In June 2018, the U.S. Department of Energy introduced the [Summit](#) scientific supercomputer at Oak Ridge National Laboratory. Summit provides unprecedented computer power for research across a broad variety of scientific domains, including artificial intelligence, energy, and advanced materials. Summit also provides unmatched capabilities for integrating AI and scientific discovery. In May 2019, DOE announced plans to build the [Frontier supercomputer](#), which is expected to debut in 2021 as the world's most powerful computer that maintains U.S. leadership in high-performance computing and AI.

The National Science Foundation (NSF) also invests significantly in the exploration, development, and deployment of a wide range of cyberinfrastructure technologies that can be useful for AI R&D, including next-generation supercomputers. In 2018, [NSF funded the largest and most powerful supercomputer](#) the agency has ever supported to serve the nation's science and engineering research community. The new high-performance computing system, called Frontera, will be a system with the highest scale, throughput, and data analysis capabilities ever deployed on a university campus in the United States.

The National Aeronautics and Space Administration also has a strong high-end computing program, and is augmenting their [Pleiades supercomputer](#) with new nodes specifically designed for MLAI workloads.

Credit: Carlos Jones, Oak Ridge National Laboratory/U.S. Dept. of Energy

Summit supercomputer at Oak Ridge National Laboratory

“Today’s launch of the Summit supercomputer demonstrates the strength of American leadership in scientific innovation and technology development. It’s going to have a profound impact in energy research, scientific discovery, economic competitiveness, and national security,” said Secretary Perry. “Summit will empower scientists to address a wide range of new challenges, accelerate discovery, spur innovation, and above all, benefit the American people.”

Rick Perry

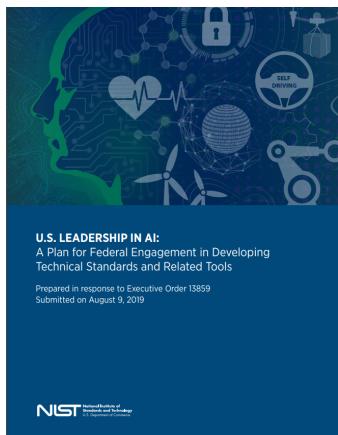

Data Resources for AI R&D

High quality datasets are critically important for training many types of AI systems. The Federal government facilitates AI innovation by investing in shared public datasets. The American AI Initiative calls for agencies to make Federal data, models, and computing resources more available to America's AI R&D experts, researchers, and industries. This will be done to foster public trust and increase the value of these resources to AI R&D experts, while maintaining the safety, security, civil liberties, privacy, and confidentiality protections we all expect. These efforts will work in concert with the President's Management Agenda and implementing the Open, Public, Electronic, and Necessary, (OPEN) Government Data Act. In March of 2018, the President's Management Agenda laid out a new Cross-Agency Priority (CAP) goal of leveraging data as a strategic asset. This CAP goal will result in the development and implementation of the Federal Data Strategy, which defines principles, practices, and an action plan to generate a more consistent approach to the use, access, and stewardship of Federal data. In addition, the National Science Foundation is leading in the development of a cohesive, federated, national-scale approach to research data infrastructure through the Harnessing the Data Revolution Big Idea. This initiative provides a significant opportunity to transform research across all areas of science and engineering, including AI. Together, these actions will drive our top-notch AI research toward new technological breakthroughs and promote scientific discovery, economic competitiveness, and national security.

R&D for AI Standards

Standards are essential for ensuring that AI technologies meet critical objectives for functionality and interoperability. The Federal government engages in the development of technical standards and related tools in support of reliable, robust, trustworthy, secure, portable, and interoperable systems that use AI technologies. These activities ensure that technical standards for AI reflect Federal priorities for innovation, public trust, and confidence.

The National Institute of Standards and Technology (NIST) is the leader in advancing foundational research in measuring and assessing AI technologies, including the development of AI data standards and best practices, as well as AI evaluation methodologies and standard testing protocols. As directed by the American AI Initiative, NIST released a plan in August 2019 for Federal engagement in the development of AI technical standards.

U.S. Leadership in AI: A Plan for Federal Engagement in Developing Technical Standards and Related Tools, August 2019

03

AI for American Industry

AI innovation can be hampered or driven overseas by overly restrictive government regulations. We will create a national climate where scientists and technologists successfully develop their new AI inventions here in the United States. Under this Administration, we are removing regulatory and other barriers to the safe development and testing of AI technologies, to enable the creation of new AI-based industries and the adoption of AI by existing industries. In January 2020, the White House proposed [AI regulatory principles](#) for the use of AI in the private sector. These transparent regulatory principles, which are open for public comment, are designed to achieve three goals: ensure public engagement, limit regulatory overreach and promote trustworthy technology. In concert, agencies are developing regulatory and non-regulatory approaches for innovative uses of AI while also upholding civil liberties, privacy, and American values.

Examples of these approaches include the Department of Transportation's work to safely integrate driverless cars onto traditional roadways, the FDA's approval of the first ever AI-based device for medical diagnostics, and the FAA's work to speed the integration of unmanned aerial systems into the Nation's airspace. Additionally, the [U.S. Patent and Trademark Office](#) is exploring intellectual property policy considerations of AI.

The Federal government welcomes additional ideas from the American public on barriers that can be removed to speed AI innovation while also protecting privacy, civil liberties, and the safety of the American public.

Transportation

**Healthcare****Manufacturing****Financial Services****Agriculture****Weather Forecasting****National Security & Defense**

Transportation

Autonomous systems, such as unmanned aircraft systems (drones) and self-driving vehicles, offer tremendous benefits to our economy and society. They promise to transform the delivery of household goods, provide mobility options for senior citizens and Americans with disabilities, improve the safety of dangerous occupations, and expand access to life-saving medical supplies. In partnership with State and local governments, the Trump Administration, through the Department of Transportation and NASA, is working to enable the safe operation of these systems on our roadways and in our airspace.

“It shall be the policy of the United States to promote the safe operation of unmanned aircraft systems (UAS) and enable the development of UAS technologies for use in agriculture, commerce, emergency management, human transportation, and other sectors.”

President Donald J. Trump

Unmanned Aircraft Systems

On October 25, 2017, President Trump signed a [Presidential Memorandum](#) directing Secretary of Transportation Elaine Chao to establish an unmanned aircraft system (UAS) integration pilot program (IPP), which the President signed into law with the 2018 Federal Aviation Administration (FAA) Reauthorization Act. Two weeks later, Secretary Chao announced the creation of the [UAS IPP](#) to develop and safely test the further integration of UAS in a select number of State, local, and tribal jurisdictions. Over the following months, the Federal Aviation Administration (FAA) heard from more than 2,500 interested parties, with more than 300 state, local, and tribal governments interested in taking part. On May 10, 2018, Secretary Chao announced the selection of [ten program awardees](#), spanning the continental United States and Alaska. These awardees are conducting a range of novel and innovative UAS operations, including pairing drones with 5G test networks, eradicating pestilent mosquito populations, and delivering life-saving medical equipment in emergency situations. Data gathered from these pilot projects will form the basis of a new regulatory framework.

In January 2019, [FAA announced](#) proposed new rules to allow drones to fly at night and over people without waivers under certain conditions and to further integrate drones safely into the national airspace system. FAA also announced the Unmanned Aircraft System Safe and Secure Advanced Notice of Proposed Rulemaking. This proposal identifies major drone safety and security issues that may pose a threat to other aircraft, to people on the ground, or to national security. It is soliciting recommendations to reduce these risks as drones are integrated into our national airspace.

The FAA has established the [UAS Data Exchange](#), a collaborative approach to facilitate the sharing of airspace data between government and industry, which has already led to shortened processing times for airspace authorizations for UAS operators. In coordination with the FAA, NASA continues development of a UAS Traffic Management (UTM) system, and in May 2018 released Version 1.0 of the [UTM Concept of Operations](#).

FAA Recent UAS Initiatives

“UAS present opportunities to enhance the safety of the American public, increase the efficiency and productivity of American industry, and create tens of thousands of new American jobs.”

President Donald J. Trump

Autonomous Vehicles

The development and deployment of automated vehicles (AV) and automated driving systems (ADS), have the potential to reduce the number and severity of serious automobile crashes. Over 90 percent of these crashes are due to human error, according to the National

Highway Traffic Safety Administration (NHTSA), and automation can help in preventing injuries and saving lives. The market for automated vehicles is anticipated to be over \$40 billion in 2025 and more than \$75 billion in 2035. In addition, fully automated vehicles have the potential to present new transportation options for older Americans and those with disabilities, increasing their connectivity and independence.

The Department of Transportation (DOT) is taking active steps to develop guidance for how best to integrate automated vehicles and driving systems into our transportation system. In January 2020, DOT released "[**Ensuring American Leadership in Automated Vehicle Technologies: Automated Vehicles 4.0**](#)," which details ten U.S. Government principles to protect users and communities, to promote efficient markets, and to facilitate coordinated efforts to ensure a standardized Federal approach to American leadership. This new document builds off of the Department's [**2018 AV 3.0 guidance**](#) and [**2017 ADS 2.0 guidance**](#), which focused on innovation for surface transportation modes, and safe testing and integration of Automated Driving Systems, respectively.

Max Ortiz, Associated Press

Secretary of Transportation Elaine L. Chao inspecting an automated driving system in Ann Arbor, Michigan.

[**Ensuring American Leadership in Automated Vehicle Technologies: Automated Vehicles 4.0**](#)

“The safe deployment of automated vehicle technologies means we can look forward to a future with fewer traffic fatalities and increased mobility for all Americans.”

Secretary of Transportation Elaine L. Chao

Healthcare

Artificial intelligence has immense potential to advance healthcare, accelerate medical research, and support the health and well-being of all Americans. This is especially true as AI technologies are leveraged as part of the global response to the coronavirus pandemic.

The Trump Administration has led key initiatives to harness the power of AI to fight the virus. Working alongside industry, academic, and nonprofit leaders, the White House coordinated the release of the COVID-19 Open Research Dataset (CORD-19), the most comprehensive collection of machine readable scholarly articles on coronavirus to date. The White House then issued a [call to action to the AI community](#) to develop [publicly available](#) AI tools and techniques that can help researchers summarize and analyze the dataset.

The U.S. Department of Energy’s Oak Ridge National Laboratory is [using artificial intelligence and high performance computing to accelerate COVID-19 treatment and vaccine research](#). Capitalizing on America’s world-class AI and HPC capabilities, the White House led an effort with DOE, the National Science Foundation, and leading industry and academic partners to establish the [COVID-19 High Performance Computing Consortium](#). Through the consortium, Federal government, industry, and academic leaders volunteer free compute time and resources to COVID-19 researchers.

Outside of the pandemic, the Trump Administration has taken important action to remove barriers to AI innovation in healthcare. The U.S. Food and Drug Administration has had a key role in this effort, starting with the first FDA approval of an [AI-powered medical device](#) in 2018. Since then, the FDA has permitted marketing of [AI-based software](#) that can help healthcare providers detect wrist fractures more quickly, and began developing an adaptive framework for [smart software in medical devices](#), such as electrocardiogram (EKG) devices that estimate the probability of a heart attack. The FDA also [approved an AI tool](#) to help detect coronavirus in CT scans. In addition, the FDA along with the Centers for Disease Control and Prevention (CDC) partnered to advance research in machine learning and natural language processing by [creating free tools that will improve the collection of clinical data](#).

The Department of Health and Human Services (HHS) is promoting medical innovation through the Division of Research, Innovation, and Ventures (DRIVE) [by offering partnerships with public and private institutions](#). For example, DRIVE seeks to provide innovative solutions to diseases such as sepsis by introducing machine learning algorithms to treat the disease. HHS also worked on a [Health Tech Sprint](#) to show how AI can be applied to Federal data to create products for healthcare applications.

The Centers for Medicare & Medicaid Services’ (CMS) Center for Medicare and Medicaid Innovation (Innovation Center) launched the [Artificial Intelligence \(AI\) Health Outcomes Challenge](#), in collaboration with the American Academy of Family Physicians and the Laura and John Arnold Foundation. The CMS AI Health Outcomes Challenge will distribute up to \$1.65 million to encourage further

progress in AI for health and health care and to accelerate development of real-world applications for this technology, such as predicting unplanned hospital and skilled nursing facility admissions and adverse events.

The National Institutes of Health is exploring many opportunities for [AI to accelerate medical advances in biomedical research](#). NIH has large data sets resulting from projects such as the NIH Human Microbiome Project and the All of Us Research Program. These data sets provide great opportunity for AI to foster discovery. In 2019, reports on work funded by NIH, researchers were able to use [AI to catch irregular heartbeats](#), indicating that AI can be used to improve the accuracy and efficiency of EKG readings. NIH also launched a working group on AI to explore ways to make the best use of existing data, and harness the potential of AI to advance biomedical research and the practice of medicine.

Manufacturing

State-of-the-art advances in manufacturing help our economy and empower our workforce. In July of 2018, the National Counterintelligence and Security Center (NCSC) identified manufacturing areas such as chemical manufacturing, advanced robotics and artificial intelligence, aircraft parts, integrated circuits, space and exploration technology, etc., as areas under threat from foreign espionage. In the face of intense global competition, President Trump unveiled a [National Strategic Plan on Advanced Manufacturing](#) in October 2018 that focuses on defending the economy, expanding manufacturing employment, and ensuring a strong manufacturing and defense industrial base and a resilient supply chain.

The National Institute of Standards and Technology (NIST) is working to provide the tools to move our industries into the smart manufacturing generation. By developing automated, distributed sensing, and autonomous control systems, the Trump Administration wants to increase the operational efficiency of factories across the United States. In April of 2018, and for the first time ever, NIST published guidelines and best practices for introducing wireless technology into smart manufacturing. Our leadership in modern manufacturing comes with economic threats such as those related to cybersecurity.

“Optimism among American manufacturers has hit all-time highs as American businesses across the country have paid bonuses, increased wages, and boosted contributions to employee retirement plans.”

— [President Donald Trump \(07/17/18\)](#)

ORNL’s MDF Industry Collaboration Program

This program connects industry partners with national laboratory and academic experts to test and implement state-of-the-art technologies for manufacturing processes.

High Performance Computing for Manufacturing (HPC4Mfg) Program

The DOE’s Lawrence Livermore National Laboratory (LLNL) is home to the High Performance Computing for Manufacturing (HPC4Mfg)

Program. The goal of this program is to bring industry manufacturers to use high-performance computing to develop simulations that will advance manufacturing technology.

Financial Services

Under the leadership of President Trump, the United States' economy is growing at a fast pace. The Department of the Treasury is pursuing policies that promote the adoption of innovating tools such as AI and machine learning while removing unnecessary regulatory barriers. These new tools will empower the American people by helping them make more informed decisions about their short-term and long-term financial goals.

The U.S. Securities and Exchange Commission (SEC) is actively implementing machine learning algorithms to monitor and detect potential investment market misconduct. Additionally, in September 2019, the Consumer Financial Protection Bureau (CFPB) issued new policies that allow for an increased use of data and machine learning algorithms in financial products and services. These policies will help unleash innovation in the financial sector, driving competition that lowers prices and provides consumers with more and better products and services. New approaches can also expand access to the benefits of the financial system for Americans of all backgrounds.

“Financial institutions have been improving their ability to monitor transactions and conduct link analysis with new technologies that rely on artificial intelligence and machine learning. Being proactive on this front is more important than ever in your sector given the sophisticated ways actors use to move money and goods. We applaud efforts to use new technologies to identify and build out networks and make better decisions about who you should and should not be doing business with.”

CFPB Policies to Facilitate Compliance and Promote Innovation

Artificial Intelligence. Emerging Opportunities, Challenges, and Implications

This Report to the Committee on Science, Space, and Technology, House of Representatives highlights, among other items, the benefits and challenges of deploying artificial intelligence technologies to financial services.

Agriculture

Confronting one of the biggest challenges facing agriculture today—feeding an additional 2 billion people by 2050—the [U.S. Department of Agriculture](#) (USDA) is positioning farmers, scientists, educators, and the American public to benefit from artificial intelligence, providing economic opportunity through innovation, helping rural America to thrive, and promoting more efficient and profitable agricultural production.

NIFA has launched a data science initiative, [Food and Agriculture Cyberinformatics and Tools](#), to accelerate and expand on a diverse portfolio of AI-related programs that represent a multitude of uses in agricultural production, sensor development, bioinformatics, ecosystem management, rural community support, and workforce development through education and training at all levels. This work includes robotic solutions that utilize AI technologies to assist in pollination, weeding, pesticide applications, and fruit harvesting; AI algorithms that assist in identifying plant, animal and tree species that contribute to pest control and ecosystem management; and adaptive groundwater and watershed models to maintain resilience of agricultural systems. NIFA's investments contribute to a wide breadth of AI-relevant research including big data, machine learning, autonomous systems, computer vision and intelligent decision support systems, as well as the socioeconomic and workforce considerations with rapidly increasing role of AI in U.S. agriculture.

ARS is collaborating with industry to advance the role of AI in monitoring livestock, using robots to sort harvests, analyzing irrigation systems, and utilizing UAV technology to analyze crop health and efficiently apply pesticides. Their programs include the use of automated calculations to analyze crop foliage composition and then guide the application of pesticides; self-propelled apple sorting machines that use algorithms to quickly sort the fruit; and aerial monitoring of fungi levels on corn and other crops using computer vision and deep learning.

ERS is conducting research and development to use machine learning and AI to create better crop yield models based on weather data and analysis.

USDA's work in AI and data science brings revolutionary technology to agriculture with the potential to transform our ability to bring high-quality food to America's dinner table.

Weather Forecasting

The National Oceanic and Atmospheric Administration (NOAA) is using AI to better understand and predict the dynamic environment we live in. The American AI Initiative prioritizes research and development investments, along with data and computational infrastructure, that will accelerate the ability of researchers to create AI that can assimilate the massive amounts of big data from our environmental

satellites into our weather models to improve predictions of hurricanes and severe storms. AI capabilities, including sensors on aerial and underwater drones led to record setting accuracy in forecasts for Hurricane Florence that led to over 200,000 lifesaving evacuations 4 days before the storm made landfall.

Other applications of AI by NOAA include improving nautical charts to ensure safe and efficient maritime commerce, surveying fish stocks to effectively manage our nation's \$208B/year recreational and commercial fishing industries, monitoring and conserving endangered species, and exploring, mapping, and monitoring the world's ocean conditions and coasts for critical national security and economic applications. NOAA also uses onboard AI and machine learning techniques in NOAA satellites help protect the environmental spacecraft during radiation events that could corrupt satellite computers. Automated software checks built into the onboard system can detect charged particles passing through onboard electronics, and then initiate contingency procedures to clear error conditions and help return satellites to full functionality.

“NOAA, in cooperation with academia and the private sector, is riding the wave of exponential improvements in Artificial Intelligence to dramatically advance our mission to protect life and property and empower the nation’s economy”

NOAA Assistant Secretary of Commerce for Oceans and Atmosphere Rear Adm. Tim Gallaudet, USN (retired)

National Security & Defense

On December 18, 2017, President Trump signed a new [National Security Strategy](#) that calls on America to lead in research, technology, invention, and innovation in emerging technologies, including artificial intelligence. The Trump Administration's commitment to AI is exemplified in the [National Defense Strategy](#), where the Administration states its intent to invest broadly in military application of AI and machine learning alongside other emerging technologies. The Administration's commitment to advanced AI R&D is evident in the [FY 2020 Administration Research and Development Budget Priorities](#) memo, which calls for investment in AI, quantum information science, and strategic computing as critical components of our national security.

In June 2018, the DoD established the [Joint Artificial Intelligence Center](#) (JAIC) to serve as the focal point in the use of AI for key defense missions. The JAIC accelerates the delivery of AI-enabled capabilities, scales the DoD-wide impact of AI, and synchronizes the DoD's AI activities. The JAIC further aims to spur momentum in the use of AI for DoD by focusing on a set of challenging use cases that can benefit from AI, including perception, predictive maintenance, humanitarian assistance and disaster relief, and cyber sensemaking, all detailed at [ai.mil](#). The JAIC's mission is to both deliver new AI-enabled capabilities to DoD end users, as well as to incrementally develop a common foundation of shared data, reusable tools, frameworks, libraries, and standards that are essential for scaling the impact of AI across DoD.

In February 2019, the Department of Defense released its [DoD AI Strategy](#), which focuses efforts on harnessing AI to advance our Nation's security and prosperity. The DoD AI Strategy defines the JAIC as the focal point of DoD's AI efforts, and outlines on the following

key strategic aims: delivering AI-enabled capabilities for key missions; partnering with leading private sector technology companies, academia, and global allies; cultivating a leading AI workforce; and leading in military ethics and AI safety.

Similarly in the intelligence community (IC), the Director of National Intelligence (DNI) released in January 2019 the [Augmenting Intelligence using Machines \(AIM\) Initiative](#). With scale in mind, the IC is enhancing its ability to provide much-needed data interpretation to decision makers across government.

“The impact of AI will extend across the entire Department, spanning from operations and training to recruiting and healthcare. The speed and agility with which we will deliver AI capabilities to the warfighter has the potential to change the character of warfare. We must accelerate the adoption of AI-enabled capabilities to strengthen our military, improve effectiveness and efficiency, and enhance the security of our nation.”

Mr. Dana Deasy, DOD CIO

04

AI for the American Worker

The American worker is a vital national asset, and advances in technology are changing the American workforce. Artificial intelligence is allowing American companies to focus resources on higher value work while enabling American workers to accomplish tasks more safely, effectively, and efficiently. The Nation also needs highly-skilled workers in industry and academia who can contribute to the R&D advances that create the AI of the future. The American AI Initiative calls for agencies to prioritize fellowship and training programs to help American workers gain AI-relevant skills through apprenticeships, skills programs, fellowships, and education in computer science and other growing Science, Technology, Engineering, and Math (STEM) fields. The Initiative also leverages the extensive set of actions already underway to provide education and training opportunities for America's workers.

Through an executive order establishing the National Council for the American Worker, President Trump has charged companies and trade groups across the country to sign a pledge committing to expand education, training, and reskilling opportunities for American workers – as of February 2019 over 200 companies have **pledged** to create over six and a half million such opportunities. The Trump

administration has also led several initiatives recognizing apprenticeships, STEM education, and lifelong learning as essential to America's future workforce strategy. Created by executive order, the Task Force on Apprenticeship Expansion brought private industry and government together to identify opportunities that would expand industry-recognized apprenticeships—the Task Force made 26 recommendations to the President for consideration. Additionally, through Presidential Memorandum to the Secretary of Education, President Trump has identified STEM education as an Administration priority, establishing a goal of no less than \$200 million in grant funding per year to the promotion of high-quality Computer Science and STEM education.

To ensure the Nation also has highly-skilled experts who can advance the AI technologies of the future, the Select Committee on AI has prioritized funding to train the next generation of American AI researchers. The Federal R&D agencies have a number of fellowships to support graduate and postdoctoral studies in AI.

As automation and AI become more prevalent, allowing Americans to work more efficiently and safely, the American workforce and industry must embrace lifelong learning as the way of the future. The Trump administration is committed to smart workforce initiatives that protect the American worker as a vital national asset while promoting the emerging technologies of tomorrow.

American Workforce

National Council for the American Worker

As advances in technology, automation, and AI change the national economy, so too must the country's education and job training programs change to prepare Americans for the new economy and the emerging industries of the future. President Trump's July 2018 executive order established the President's National Council for the American Worker. This Council recognizes skilled American workers as our country's most valuable resource and works to raise awareness of urgent workforce issues and develop a national strategy for empowering American workers with affordable education and skills-based training for the jobs of today and of the future.

American Workforce Policy Advisory Board

On March 6, 2019, Commerce Secretary Wilbur Ross and President Trump's Advisor Ivanka Trump officially launched the creation of the American Workforce Policy Advisory Board. This board will work together with the National Council for the American Worker to create a national strategy ensuring that all Americans have the skills and opportunity to secure good paying jobs and successfully navigate technological disruptions and the rapidly changing nature of work.

Apprenticeships

On June 15, 2017, President Trump signed an executive order, Expanding Apprenticeships in America, which established the Task Force on Apprenticeship Expansion. This task force, led by Secretary of Labor Alexander Acosta, worked throughout the year "to identify strategies and proposals to promote apprenticeships, especially in sectors where apprenticeship programs are insufficient." Through

four subcommittees ranging from education and credentialing to regulatory strategies, the Task Force presented its final report to President Trump on May 10, 2018 with 26 recommendations to promote apprenticeships for American workers.

STEM Education

In December 2018, the National Science and Technology Council's Committee on STEM Education (CoSTEM) released the [**Federal 5-Year STEM Education Strategic Plan**](#), which outlines the goals for American STEM education. These goals include building a strong foundation

of STEM literacy, increasing diversity in STEM careers, and preparing the STEM workforce of the future. In September 2017, President Trump signed a [**Presidential Memorandum for the Secretary of Education**](#), which emphasizes STEM education as a key Administration priority, establishing a goal of devoting at least \$200 million in grant funds per year to the promotion of high-quality Computer Science and STEM education. Addressing both shortages in STEM teachers at all levels and expanding access to Computer Science and STEM education, the NSTC CoSTEM is the Administration's vehicle to execute policy on this central element of American leadership in AI.

Advisor to the President Ivanka Trump and Deputy Assistant to the President for Technology Policy Michael Kratsios discuss Administration efforts at the State-Federal STEM Education Summit on June 28, 2018

5-Year STEM Education Strategic Plan

Summary from 2018 STEM Education Summit

R&D Workforce Training

With the Executive Order on AI, President Trump emphasized the importance of training the next generation of AI researchers. Federal departments and agencies that invest in AI R&D have defined AI as a priority area within Federal fellowship, training, and service programs. Opportunities are provided at all levels of advanced training, including for undergraduate and graduate students, postdoctoral researchers, and early career academic AI researchers.

Fellowship, training, and service programs:

-  **NASA: STEM Engagement**
-  **NSF: The National Science Foundation (NSF) Graduate Research Fellowship Program (GRFP)**
-  **NIST: NRC Postdoctoral Research Associateships Program**
-  **NIST: Graduate Student Measurement Science and Engineering (GMSE) Fellowship Program**
-  **NIST: Professional Research Experience Program (PREP)**
-  **DoD: National Defense Science and Engineering Graduate Fellowship**
-  **DOE: Computational Science Graduate Fellowship**
-  **State: Jefferson Science Fellows program**
-  **USDA/NIFA: Education and Workforce Development program**
-  **USDA/NIFA: National Needs Graduate and Postgraduate Fellowship Grants Program**
-  **USDA/NIFA: Higher Education Multicultural Scholars Program**

Vocational Training

The National Science Foundation leads the way on [Advanced Technological Education](#) (ATE), publishing a program solicitation to award grants totaling \$66 million during FY19. The ATE program partners with academic institutions and industry to improve the education of technicians vital to our nation's economy. Additionally, NSF's "Big Idea" on "[Future of Work at the Human-Technology Frontier](#)" is informing AI-related elements of NSF's long-term research agenda.

CEA Report on Reskilling

05 AI with American Values

The United States has long been a champion and defender of the core values of freedom, guarantees of human rights, the rule of law, stability in our institutions, rights to privacy, respect for intellectual property, and opportunities to all to pursue their dreams. The AI technologies we develop must also reflect these fundamental American values and our devotion to helping people. Our goal is to ensure that AI technologies are understandable, trustworthy, robust, and safe. In addition, the broader impacts of AI on society must be considered, including implications for the workforce and assurances that AI will be developed responsibly. The United States is actively addressing these challenges through R&D programs and engagement with the broad stakeholder communities, including international discussions on AI development. As part of the American AI Initiative, Federal agencies will foster public trust in AI systems by establishing guidance for AI development and use across different types of technology and industrial sectors. In addition to the national strategy, the White House in January 2020 [proposed](#) guidance for the regulation of AI applications, which will help Federal regulatory agencies develop and maintain approaches for the safe and trustworthy creation and adoption of new AI technologies without stifling innovation.

As new AI technologies are created, we must also increase our understanding of how AI systems derive solutions, and why they make the decisions they make. An important R&D emphasis is on providing AI with explainability mechanisms that help human users understand reasons for AI outputs. DARPA's [Explainable AI \(XAI\) program](#) aims to create machine learning techniques that produce more explainable solutions while maintaining high performance and appropriate levels of trust in the system. NSF's [Program on Fairness in Artificial](#)

[Intelligence in Collaboration with Amazon](#) will fund research on fairness in AI, with the goal of contributing to trustworthy AI systems that are readily accepted and deployed to tackle grand challenges facing society.

Robust and safe AI

The complexity of many AI systems creates important safety and security challenges that must be addressed to ensure that these systems are trustworthy. In particular, AI systems have some inherent cybersecurity risks because of the characteristics of how the technology is designed. R&D investments such as [DARPA's AI Next Campaign](#) will create solutions for countering adversarial attacks on AI technologies, such as those that attempt to contaminate training data, modify algorithms, create adversarial inputs, or exploit flaws in AI system goals. This research is expected to lead to more secure, robust, and safe AI systems that are reliable and trustworthy.

Workforce impacts

Rapid progress in the development of AI technologies has many potential benefits, including the creation of new industries and occupations, increased opportunities for innovation, and increased productivity. However, these technologies are changing the nature of work, and have caused some concerns about the possibility of lost jobs, or the mismatch between available occupations and the skills of the workforce. Our strategy for AI and the American Worker provides educational and training opportunities that help the workforce thrive in the new economy. Beyond the immediate educational need, however, is the need to look forward to better understand the changing landscape of jobs and work. NSF is responding to this need by focusing R&D on convergent research on [The Future of Work at the Human-Technology Frontier](#). This research will help us better understand the human-technology partnership and the emerging socio-technological landscape, create new technologies to augment human performance, and foster lifelong and pervasive learning with technology.

International Leadership on AI

The Trump Administration is committed to promoting an international environment that supports AI R&D and opens markets for American AI industries while also ensuring that the technology is developed in a manner consistent with our Nation's values and interests. International engagement with likeminded partners is a key pillar of the American AI Initiative and the U.S. strategy for AI leadership.

The United States is leading in a number of international activities that promote trust in and adoption of AI technologies.

In September 2020, the Trump Administration announced the signing of the [Declaration of the United States and the United Kingdom on Cooperation in AI R&D](#). The cooperation agreement between the two nations includes recommending priorities for future cooperation in R&D, promoting researcher and student collaborations, and fostering public-private partnerships.

In May 2020, the United States led the [**G7 Science and Technology Ministerial Meeting**](#) where the United States and G7 partners agreed to launch the Global Partnership on AI (GPAI)—an international and multistakeholder initiative to [encourage the development of AI in line with our shared values](#) and contribute to the responsible development and use of AI.

In May 2019, the United States joined with other OECD countries to advance common AI principles, outlined in the [**Recommendation on AI**](#). This recommendation formalizes principles for the innovative and trustworthy development and application of AI, marking the first time that the United States and like-minded democracies have committed to common AI principles. These principles reflect many of the priorities championed by the American AI Initiative—priorities like removing barriers to innovation and discovery, prioritizing long-term R&D, building the AI workforce, and fostering public trust. In June 2019, the [**G20 also adopted these principles**](#), expanding their impact around the world.

In 2018, OSTP led the U.S. delegation to the 2018 G7 Innovation Ministerial, which resulted in a joint [**Statement on Artificial Intelligence**](#), recognizing “*the interconnected relationship between supporting economic growth from AI innovation; increasing trust in and adoption of AI; and promoting inclusivity in AI development and deployment.*”

In 2017, OSTP also led the US delegation to the G7 “ICT and Industry Ministerial”, which resulted in an [outcome document on AI](#) that recognizes that “*the rapid advancement of AI technologies has the potential to bring immense benefits to our economies and societies.*”

Deputy Assistant to the President Michael Kratsios announces U.S. support for OECD Recommendation on AI at OECD Forum in May 2019

“For the first time in history, America and likeminded democracies of the world will commit to common AI principles reflecting our shared values and priorities. These principles send a strong message: The OECD countries stand together in unleashing AI innovation, understanding that it is an essential tool to drive economic growth, empower workers, and lift up quality of life for all.”
